

Funkcionālie materiāli rezistīvai pārslēgšanas atmiņai (MATERA)

J. Purāns, E. A. Kotomins,

R. I. Eglītis, A. Kuzmins,

R. Kalendarevs, A. Popovs

2009. gada rezultāti

Galvenie teorijas mērķi:

Aprēķini no pirmajiem principiem priekš pamata defektiem kuri ir svarīgi priekš rezistīvās pārslēgšanas dopētā SrTiO₃:

-- Fe, Nb, un O vakances

Teorētiskā metode: programma CRYSTAL
kombinēta ar periodisku modeli,
izmantojot LASC paralēlo kompjūteru

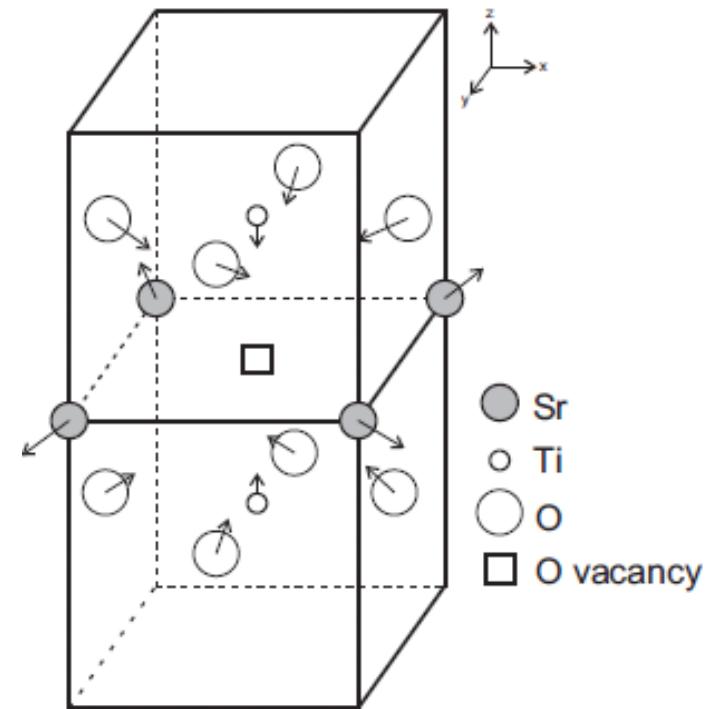

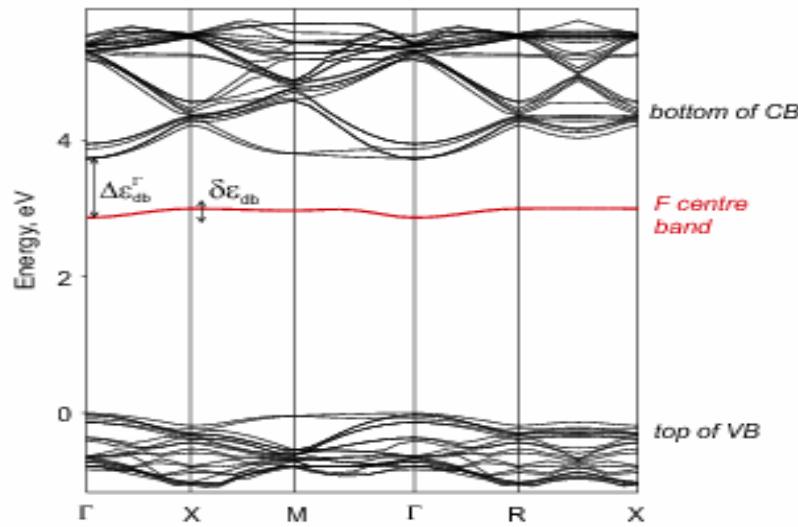

Galvenie rezultāti ir publiēti European Physical Journal B, 2009, 73, p.53-57.

First-principles study of bulk and surface oxygen vacancies in SrTiO₃ crystal

V.E. Alexandrov, E.A. Kotomin, J. Maier, R.A. Evarestov

- Max-Planck-Institut fur Festkorperforschung, Stuttgart, Germany
- Institute of Solid State Physics, University of Latvia, Latvia
- Department of Quantum Chemistry, St. Petersburg University, Russia
- R.I. Eglitis, E.A. Kotomin, tiks iesniegts, 2009

Band structure calculations and position of the bulk and surface V_o (F center) energy bands

Shallow defect levels,
easy ionization and metallization
at higher defect concentrations

Local atomic relaxation

Paper 2: *Ab initio* calculations of Nb doped SrTiO₃

R. I. Eglitis and E. A. Kotomin, in preparation

3 x 3 x 3 expanded unit cell → 135 atoms

→ relatively low 4% Nb doping

Nb replaces Ti and expands the lattice by 0.05 Å

The effective charges (Sr=+1.923e; Ti=+2.772e;
O=-1.569e; Nb=3.13e) reveal Ti-O bond
covalency (+64 me) is considerably larger than
Nb-O (+8 me) because Nb ion is more ionic

Nb is also a shallow donor in SrTiO₃

Main conclusions

- Shallow donor (bulk and surface) vacancy defects, easy material metallization even at moderate vacancy concentrations
- Large segregation trend predicted for both neutral and even more for charged vacancies (F and F^+ centers)
- F^+ centers are deeper than neutral F centers
- Nb impurity produces also shallow donor levels even at low concentration

Future work (2010):

- Charged Fe(3+) impurities:
their complexes with oxygen vacancies
in the bulk and at the surface
- Charged Fe(3+) segregation towards surface
- verification of models developed in EXAFS experiments
